## DETAILED ACTION

### *Election/Restrictions*

This application contains claims directed to more than one species of the generic invention. These species are deemed to lack unity of invention because they are not so linked as to form a single general inventive concept under PCT Rule 13.1.

The species are as follows:

Species I concerns an optical phase detector characterized in that a voltage-controlled electro-optic phase modulator is used to modulate the phase of an optical input.

Species II concerns a laser stabilization apparatus and a method for stabilizing the output from a laser wherein a relative delay is introduced between the two primary optical outputs and the difference of the signals is fed back to the laser.

Applicant is required, in reply to this action, to elect a single species to which the claims shall be restricted if no generic claim is finally held to be allowable. The reply must also identify the claims readable on the elected species, including any claims subsequently added. An argument that a claim is allowable or that all claims are generic is considered non-responsive unless accompanied by an election.

Upon the allowance of a generic claim, applicant will be entitled to consideration of claims to additional species which are written in dependent form or otherwise include all the limitations of an allowed generic claim as provided by 37 CFR 1.141. If claims are added after the election, applicant must indicate which are readable upon the elected species. MPEP § 809.02(a).

Art Unit: 2881

The claims are deemed to correspond to the species listed above in the following manner:

Claims 1-26 and 39 are directed to Species I.

Claims 27-38 and 40-42 are directed to Species II.

Currently there is no generic.

The species listed above do not relate to a single general inventive concept under PCT Rule 13.1 because, under PCT Rule 13.2, the species lack the same or corresponding special technical features for the following reasons: No common specific technical features can be seen which could be said to incorporate a common inventive concept. In the first group, the phase is measured by controlling the voltage-controlled modulator to be at zero voltage. This technique has no common feature with the stabilization feedback that can be used without such a voltage-controlled modulator (page 23, second paragraph). Thus, these claims are directed at different apparatuses solving different problems without a common concept.
